**Co-Supervisor:** Epinat Benoit (LAM)

Internship at IRAP  
11 March 2019 - 26 July 2019

# Galaxy evolution through time

# Why studying kinematics ?

Explain the co-evolution of morphology with kinematics

- ▷ main processes responsible for disc formation and settling ?
- ▷ impact of merging, inflows and outflows on these processes ?
- ▷ kinematics  $\rightarrow$  rotation curve  $\rightarrow$  dark matter and angular momentum distribution ?

## IFS:

- ▷ 3D cubes (2D spatial + 1D spectral)  
→ **photometry + kinematics**

## MUSE:

- ▷  $1 \times 1 \text{ arcmin}^2$  FoV → **environment**
- ▷ 0.2 arcsec spatial sampling
- ▷ spectral range [4650 Å, 9300 Å]
- ▷ seeing-limited or AO observations
- ▷ high sensitivity  
→ **low-mass galaxies + blind surveys**

# Our sample

HST image of COSMOS group CGr30

- ▷ 16 MUSE fields in COSMOS area
- ▷ exposures from 1 to 10 hr
- ▷ seeing-limited ( $\text{FWHM} \lesssim 0.7''$ ) or AO ( $\text{FWHM} \lesssim 0.5''$ )
- ▷  **$\sim 500$  field galaxies with [OII] detection**
  - HST-ACS counterparts
  - **$0.4 \leq z \leq 1.4$**

# Methodology

## I. Morphological information

- ▷ **half-light radius**  $R_{1/2}$  to select resolved galaxies
  - Cassata, Tasca and Zurich catalogues
- ▷ **ellipticity** to compute the inclination
  - fixed input for the kinematical model

## II. Kinematical modelling

- ▷ recover  $V_{\max}$  and  $\sigma_v$

## III. Tully-Fisher relation

# Checking morphological parameters

## Half-light radius

spheroidal disk-like irregulars

GALFIT run by V.  
Abril-Melgajero (LAM)  
on structure galaxies  
▷ GALFIT radius  
used as a reference

# Checking morphological parameters

## Ellipticity

▷ values are consistent between catalogues

▷ scatter is due to bulge dominated (spherically symmetric) systems

# Characteristics of our sample

## Redshift distribution

The total number corresponds to galaxies with photometric data in Cassata and/or Zurich catalogues.

- ▷ sample of **103 galaxies** with  $R_{1/2} > 0.35''$  and  $\text{SNR} > 5$
- ▷ we loose galaxies at  $z \approx 1.4$
- ▷ redshift distribution is not drastically changed

# Characteristics of our sample

## Mass-SFR relation

- ▷ Most of our sample galaxies are on the main sequence
- ▷ massive quiescent (low [OII]) and very low mass galaxies are lost

# Kinematical modelling

## Cleaning galaxies

# Kinematical modelling

## Fitting a model

Use a ramp model  
with a **linear**  
**internal variation**  
and a **plateau**.

## Short term:

- ▷ TFR evolution with  $z$

## Long term:

- ▷ Improve morphological modelling
- ▷ Angular momentum evolution ?
- ▷ Dark matter vs. luminous mass ?
- ▷ **better selection + larger sample**
