Supervisor: Contini Thierry (IRAP) Co-Supervisor: Epinat Benoit (LAM)

Internship at IRAP 11 March - 26 July 2019

Galaxy evolution through cosmic time

Why studying kinematics?

Explain the co-evolution of morphological and dynamical properties of galaxies

- \triangleright main processes responsible for disc formation and settling ?
- $\,\rhd\,$ impact of merging, inflows and outflows on these processes ?
- \triangleright kinematics \rightarrow rotation curve \rightarrow dark matter and angular momentum distribution ?

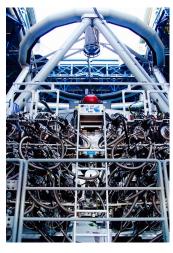

Integral Field Spectroscopy & MUSE

IFS:

- \triangleright 3D cubes (2D spatial + 1D spectral)
 - \rightarrow photometry + kinematics

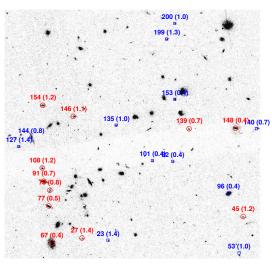

MUSE:

- $\triangleright 1 \times 1 \operatorname{arcmin}^2 \operatorname{FoV} \to \mathbf{environment}$
- \triangleright 0.2 arcsec spatial sampling
- ightharpoonup spectral range [4650 Å, 9300 Å]
- ▶ seeing-limited or AO observations
- - ightarrow low-mass galaxies + blind surveys

MUSE instrument. Credit: Contini Thierry (IRAP)

Initial sample

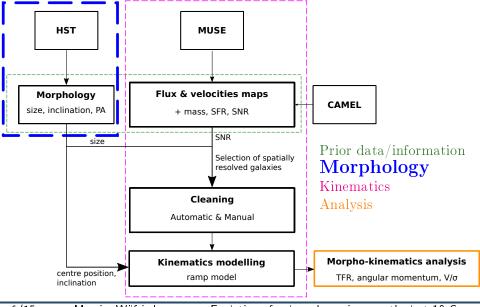

HST image of COSMOS group CGr30

- > 16 MUSE fields in COSMOS area
 - \rightarrow exposures from 1 to 10 hr
 - seeing-limited (FWHM $\lesssim 0.7$ ") or AO
- $ho \sim 500$ field galaxies with [OII] detection

 $(\text{FWHM} \leq 0.5\text{"})$

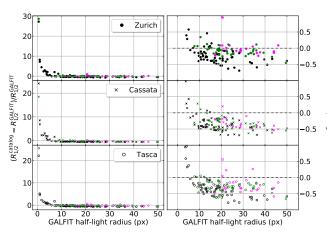

- · HST-ACS counterparts
- $\cdot \ \ 0.4 \leq z \leq 1.4$

Methodology

6/15 Mercier Wilfried Evolution of galaxy dynamics over the last 10 Gyrs..

Checking morphological parameters Half-light radius

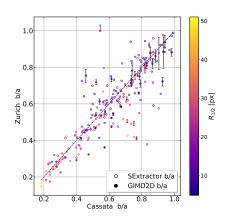

GALFIT run by V. Abril-Melgajero (LAM) on structure galaxies

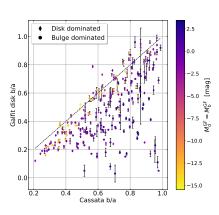

> GALFIT radius used as a reference

spheroidal disk-like irregulars

Checking morphological parameters **Ellipticity**

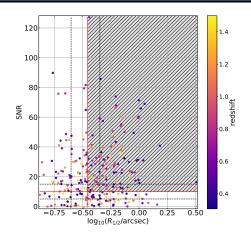

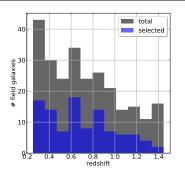

values are consistent between catalogues

> scatter is due to bulge dominated (spherically symmetric) systems

Sample selection and redshift distribution

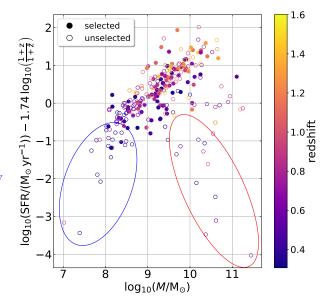

The total number corresponds to galaxies with photometric data in Cassata and/or Zurich catalogues.

- \triangleright sample of 103 galaxies with $R_{1/2} > 0.35$ " and SNR > 5
- \triangleright we loose galaxies at $z \approx 1.4$
- > redshift distribution is not drastically changed

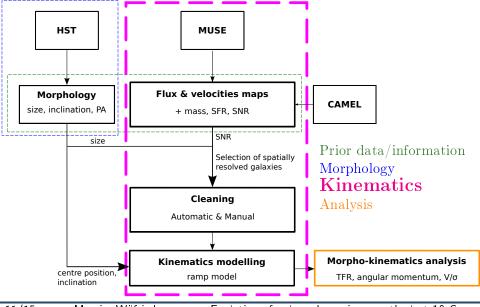

Characteristics of our sample Mass-SFR relation

Most of our sample galaxies are on the main sequence

> massive quiescent (low [OII]) and very low mass galaxies (small size) are lost

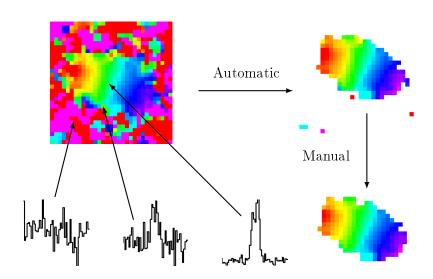

Methodology

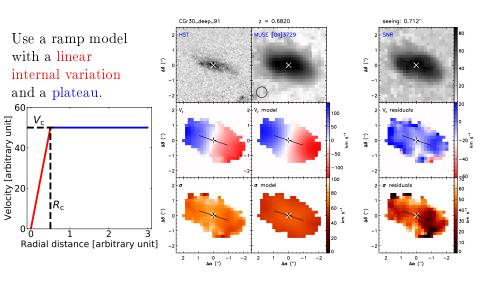

11/15 Mercier Wilfried Evolution of galaxy dynamics over the last 10 Gyrs..

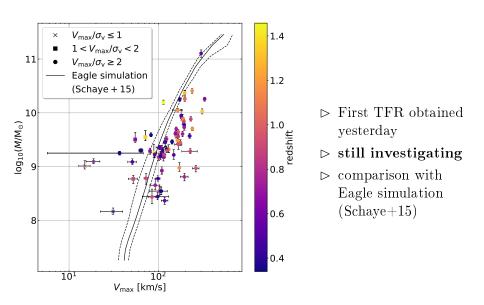

Kinematical modelling Cleaning galaxies

Kinematical modelling Fitting a model

First results Tully-Fisher Relation

Perspectives

Short term:

 \triangleright TFR evolution with z

Long term:

- ▷ Improve morphological modelling
- > Angular momentum evolution ?
- > Dark matter vs. luminous mass?
- \triangleright better selection + larger sample
